

ceetec® Rim Impact Improvement of the Revolution27

Our new technology, which we use in our current new prototype series Revolution27 rims is now definitely and taken over in the finished series.

In detail, the area of the side flanks towards the profile edges of the rim we have a noticeable improvement for a higher strength. This in turn brings also in the whole rim even more rigidity.

A impressive development step by keeping the lightweight construction constant.

The new rim allows us a maximum impact force of 1065 N.

In the area of the yellow markings and blue zone, we consciously add a new type and more fibers, thereby gaining the greater strength and, over the entire rim, a higher stiffness. As a result in 7% more stronger.

We can safely claim to have one of the most stable and lightest rims that can compete in mountainbike racing at the world cup level.

Together with the extremely high spoke tension, which allows our rim, we generate an impeller that is unparalleled.

If rock garden, hard starts, fast descents - we keep your track.

Thank you

your ceetec®
